# The setup in a nutshell

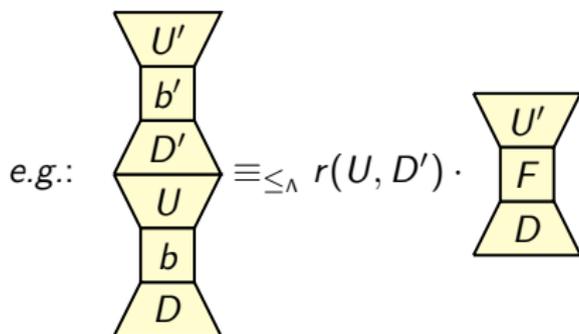

# The setup in a nutshell

Clifford, Munn, Ponizovskii, Green  $\sim 1942++$ , Kazhdan–Lusztig  $\sim 1979$ ,  
 Graham–Lehrer  $\sim 1996$ , König–Xi  $\sim 1999$ , Guay–Wilcox  $\sim 2015$ , many more

A sandwich cellular algebra is an algebra together with a sandwich cellular datum:

- ▶ A partial ordered set  $\Lambda = (\Lambda, \leq_\Lambda)$  and a set  $M_\lambda$  for all  $\lambda \in \Lambda$
- ▶ an algebra  $B_\lambda$  for all  $\lambda \in \Lambda$  The sandwiched algebra(s)
- ▶ a basis  $\{c_{D,b,U}^\lambda \mid \lambda \in \Lambda, D, U \in M_\lambda, b \in B_\lambda\}$
- ▶  $c_{D,b,U}^\lambda \cdot a \equiv_{\leq_\Lambda} \sum r_a(U, D') \cdot c_{D,F,U'}^\lambda$

Local intersection forms:   $\equiv_{\leq_\Lambda} r(U, D') \cdot$  

Clifford, Munn, Ponizovskii, Green  $\sim 1942++$ , Kazhdan–Lusztig  $\sim 1979$ ,  
 Graham–Lehrer  $\sim 1996$ , König–Xi  $\sim 1999$ , Guay–Wilcox  $\sim 2015$ , many more

A sandwich cellular algebra is an algebra together with a sandwich cellular datum:

► A partial ordered set  $\Lambda = (\Lambda, \leq_\Lambda)$  and a set  $M_\lambda$  for all  $\lambda \in \Lambda$

► an algebra  $\mathcal{A} = (\mathcal{A}, \cdot, \circ, \circlearrowleft, \circlearrowright, \circlearrowup, \circlearrowdown)$

► a basis

►  $c_{D,b,U}^\lambda$

The local intersection forms give a pairing matrix:

Computing local intersection forms is key  
 but I mostly ignore them for this talk

Local intersection forms:  $\begin{array}{c} D' \\ U \end{array} \equiv_{\leq_\Lambda} r(U, D') \cdot \boxed{b''}$

## Running example. The Brauer algebra, following Fishel–Grojnowski ~1995

- ▶ Brauer's centralizer algebra  $Br_n(c)$ :

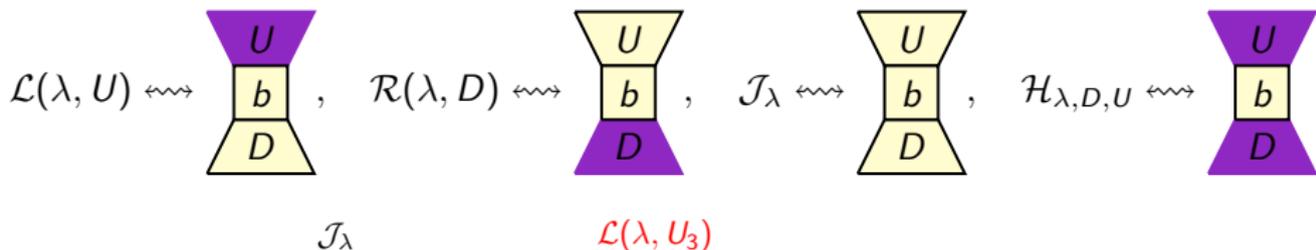

$n = 4$  example: , circle evaluation:  $\bigcirc = c \cdot \emptyset$

- ▶  $\Lambda = \{n, n - 2, \dots\}$
- ▶ Down diagrams  $D =$  cap configurations, up diagrams  $U =$  cup configurations
- ▶ the sandwiched algebra is the symmetric group  $S_\lambda$

$$\begin{aligned} \text{trapezoid } U &= \text{cup configuration} \\ \text{square } b &= \text{crossing} \\ \text{trapezoid } D &= \text{cap configuration} \end{aligned}$$

# Green cells – left $\mathcal{L}$ , right $\mathcal{R}$ , two-sided $\mathcal{J}$ , intersections $\mathcal{H}$

Fixing (colored) right, left, nothing or left-right gives:

$c_{D_1 * U_1}$	$c_{D_1 * U_2}$	$c_{D_1 * U_3}$	$c_{D_1 * U_4}$	$\dots$	
$c_{D_2 * U_1}$	$c_{D_2 * U_2}$	$c_{D_2 * U_3}$	$c_{D_2 * U_4}$	$\ddots$	$\mathcal{H}_{\lambda, D_2, U_3}$
$c_{D_3 * U_1}$	$c_{D_3 * U_2}$	$c_{D_3 * U_3}$	$c_{D_3 * U_4}$	$\ddots$	$\mathcal{H}_{\lambda, D_3, U_3}$
$c_{D_4 * U_1}$	$c_{D_4 * U_2}$	$c_{D_4 * U_3}$	$c_{D_4 * U_4}$	$\ddots$	
$\vdots$	$\ddots$	$\ddots$	$\ddots$	$\ddots$	

$\mathcal{R}(\lambda, D_3)$

## Back to Brauer

$\mathcal{J}_2$  with two through strands for  $n = 4$ : columns are  $\mathcal{L}$ -cells, rows are  $\mathcal{R}$ -cells and the small boxes are  $\mathcal{H}$ -cells

multiplication  
table of the  
colored box:

$$\begin{array}{l}
 \text{Diagram 1} = \text{Diagram 2} \\
 \text{Diagram 3} = \text{Diagram 4} \\
 \text{Diagram 5} = \text{Diagram 6} \\
 \text{Diagram 7} = \text{Diagram 8}
 \end{array}$$

## The Clifford–Munn–Ponizovskii theorem

---

An apex is a  $\lambda \in \Lambda$  such that  $\text{Ann}_A(M) = \mathcal{J}_{>\lambda}$  and  $r(U, D)$  is invertible for some  $D, U \in M(\lambda)$ . Easy fact. Every simple has a unique associated apex

---

**Theorem** (works over any field).

- ▶ For a fixed apex  $\lambda \in \Lambda$  there exists  $\mathcal{H}_{\lambda, D, U} \cong B_\lambda$
- ▶ there is a 1:1-correspondence

$$\{\text{simples with apex } \lambda\} \xleftrightarrow{1:1} \{\text{simple } B_\lambda\text{-modules}\}$$

- ▶ under this bijection the simple  $L(\lambda, K)$  associated to the simple  $B_\lambda$ -module  $K$  is the head of the induced module

Simple-classification for the sandwich boils down to

simple-classification of the sandwiched

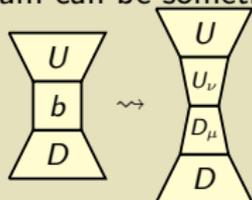

plus apex hunting

# The Clifford–Munn–Ponizovskii theorem

Sandwiched algebra = ground ring  $\Rightarrow$  cellular (without antiinvolution)

Sandwiched algebra = polynomial ring  $\Rightarrow$  affine cellular (without antiinvolution)

A sandwich datum can be sometimes made finer:

Apex hunting can be done using linear algebra (cellular pairing)

Over an algebraically closed field any finite dimensional algebra is sandwich cellular

The point is to find a “good” sandwich datum

simple-classification of the sandwiched

plus apex hunting

## Theorem (works over any field).

- ▶ If  $c \neq 0$ , or  $c = 0$  and  $\lambda \neq 0$  is odd, then all  $\lambda \in \Lambda$  are apexes. In the remaining case,  $c = 0$  and  $\lambda = 0$  (this only happens if  $n$  is even), all  $\lambda \in \Lambda - \{0\}$  are apexes, but  $\lambda = 0$  is not an apex
- ▶ the simple  $Br_n(c)$ -modules of apex  $\lambda \in \Lambda$  are parameterized by simple  $S_\lambda$ -modules

multiplication  
table of an  
 $\mathcal{H}$ -cell:

multiplication  
table of  
 $S_\lambda$ :

$$\begin{aligned}
 1 \cdot 1 &= 1, \\
 s \cdot 1 &= s, \\
 1 \cdot s &= s, \\
 s \cdot s &= 1.
 \end{aligned}$$

- Generators. Twists  $\tau_u$  and braidings  $\beta_i$

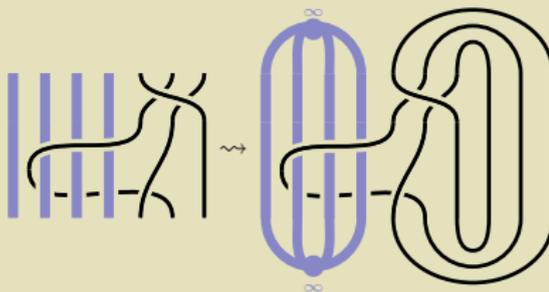

$$\tau_u = \begin{array}{c} 1 \quad u-1 \quad u \quad u+1 \quad g \quad 1 \\ \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \\ \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \quad \vdots \\ 1 \quad u-1 \quad u \quad u+1 \quad g \quad 1 \end{array}, \quad \beta_i = \begin{array}{c} i \quad i+1 \\ \times \\ i \quad i+1 \end{array}$$

- Relations. Typical Reidemeister relations and

## Simplex for $n = 1$ – why one can't do much better

---

Let us consider  $\mathbb{K} = \mathbb{C}$ . Recall that sandwiching gives us:

- ▶ For  $g = 0$  we need to classify simples of  $B_\lambda = \mathbb{C}[F_0] = \mathbb{C}$ 
  - ▷ This is the classical case
  - ▷ Simple modules of  $\mathbb{C}$ : left to the reader
- ▶ For  $g = 1$  we need to classify simples of  $B_\lambda = \mathbb{C}[F_1] = \mathbb{C}[a, a^{-1}]$ 
  - ▷ This is the affine case
  - ▷ Simple modules of  $\mathbb{C}[a, a^{-1}]$ : choose an element in  $\mathbb{C}^*$  for  $a$
- ▶ For  $g = 2$  we need to classify simples of  $B_\lambda = \mathbb{C}[F_2] = \mathbb{C}\langle a, a^{-1}, b, b^{-1} \rangle$ 
  - ▷ This is higher genus
  - ▷ Simple modules of  $\mathbb{C}\langle a, a^{-1}, b, b^{-1} \rangle$ : well...

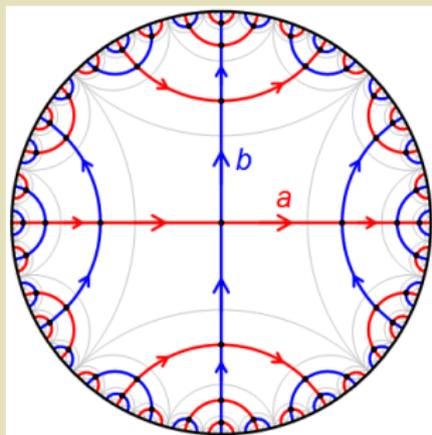

Studying representation of  $F_2 = \langle a, b \rangle$  is a wild problem:

Every choice of  $(A, B) \in (\mathbb{C}^*)^2$  gives a simple representation on  $\mathbb{C}$   
These are non-equivalent

Every choice of eigenvalues for  $a, b$  and  $ab$  gives a simple representation on  $\mathbb{C}^2$   
Under known conditions these are non-equivalent

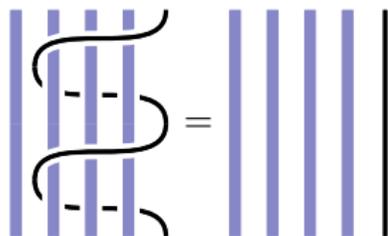

Every choice of  $A \in \mathbb{C}^*$  gives a simple representation  $\text{Ind}_{\langle a \rangle}^{F_2} A$   
These are non-equivalent

Beyond that you hit the realm of harmonic analysis, random walks and crazier stuff

## This is the last slide, I promise

- ▶ There are cyclotomic versions of handlebody diagram algebras, e.g.

- ▶ For these you get some nice(?) dimension formulas, e.g. For the higher genus version of the Ariki–Koike algebra one gets

$$\dim_{\mathbb{K}} H_{g,n}^{d,b} = (\text{BN}_{g,d})^n n!, \quad \text{BN}_{g,d} = \sum_{k \in \mathbb{N}} \sum_{\substack{0 \leq k_u \leq \min(k, d_u - 1) \\ k_1 + \dots + k_g = k}} \binom{k}{k_1, \dots, k_g}$$

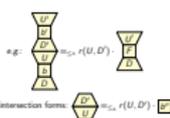

This generalizes formulas from the classical and the Ariki–Koike case:

$$\dim_{\mathbb{K}} H_{0,n}^{d,b} = n!, \quad \dim_{\mathbb{K}} H_{1,n}^{d,b} = d^n n!$$

- ▶ These are all sandwich cellular with a nice sandwich datum

A sandwich cellular algebra is an algebra together with a sandwich cellular datum:

- ▶ A partial ordered set  $(\Lambda, \leq)$  and a set  $\Omega$ , for all  $\lambda \geq \mu$
- ▶ an algebra  $B_\lambda$  for all  $\lambda \in \Lambda$  **The sandwiched algebra(s)**
- ▶ a basis  $\{c_{\lambda, \mu}^i\} | \lambda \in \Lambda, \mu \in \Omega, U \in M_\mu, B \in B_\lambda$
- ▶  $c_{\lambda, \mu}^i \rightarrow a = \sum_{\nu \geq \mu} c_{\nu, \mu}^i r(\nu, D) \cdot c_{\lambda, \nu}^j$

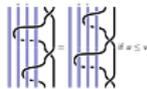

**Running example. The Bauer algebra, following Fishel-Grojnowski - 1995**

- ▶ Bauer's centralizer algebra  $B_{\mathbb{Z}/c\mathbb{Z}}$
- $n = 4$  example circle evaluation  $\bigcirc = c \cdot \mathbb{1}$
- ▶  $\Lambda = \{n, n-2, \dots\}$
- ▶ Down diagrams  $D$  = cap configurations, up diagrams  $U$  = cup configurations
- ▶ the sandwiched algebra is the symmetric group  $S_n$

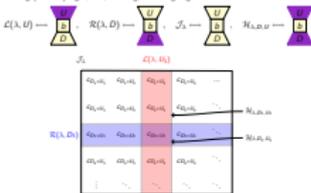

**Handbody braids  $B_{\mathbb{Z}/c\mathbb{Z}}$  (Hikinger-Olsenberg-Lambropoulos, Virelizier - 1998)**

- ▶ Generators. Twists  $\tau_{\pm}$  and braidings  $\beta_i$
- $\tau_{\pm} = \text{diagram}$ ,  $\beta_i = \text{diagram}$
- ▶ Relations. Typical Reidemeister relations and  $\beta_i \# \beta_{i+1} = \beta_{i+1} \# \beta_i$

**Goren cells - left  $L$ , right  $R$ , two-sided  $J$ , intersections  $\mathcal{H}$**

Fusing (colored) right, left, nothing or left-right gives:

**Back to Bauer**

$J_5$  with two through strands for  $n = 4$ : columns are  $L$ -cells, rows are  $R$ -cells and the small boxes are  $\mathcal{H}$ -cells

**Handbody braids** After closing, the caps correspond to curves of odd handbodies (1998)

- ▶ Generators: An Alexander closure and a handbody braid for  $g = -4$
- ▶ Relations: 

Group	type-A	type-C
$g = 0$	Classical (Aronov - 1925)	
$g = 1$	Extended affine	Classical (Brieskorn - 1973)
$g = 2$	?	Affine (Aronov - 1990)
$g \geq 3$	?	?

**The Clifford-Muru-Ponizavski theorem**

An apex is a  $\lambda \in \Lambda$  such that  $\text{Ass}_{\mathbb{Z}}(M) = \mathcal{J}_{\lambda, \lambda}$  and  $r(U, D)$  is invertible for some  $D, U \in M(\lambda)$ . Easy fact. Every simple has a unique associated apex

- ▶ **Theorem** (works over any field). For a fixed apex  $\lambda \in \Lambda$  there exists  $\mathcal{H}_{\lambda, \mu, \nu} \cong B_\mu$
- ▶ there is a 1-1 correspondence (simple with apex  $\lambda$ )  $\mathcal{H} \cong$  (simple  $B_\mu$ -modules)
- ▶ under this bijection the simple  $L(\lambda, K)$  associated to the simple  $B_\mu$ -module  $K$  is the head of the induced module

Simple-classification for the sandwiched leads down to simple-classification of the sandwiched plus apex hunting

**Bauer  $B_{\mathbb{Z}/c\mathbb{Z}}$  and the symmetric group  $S_n$**

- ▶ **Theorem** (works over any field). If  $c \neq 0$ , or  $c = 0$  and  $\lambda \neq 0$  is odd, then all  $\lambda \in \Lambda$  are apices. In the remaining case,  $c = 0$  and  $\lambda = 0$  (this only happens if  $n$  is even), all  $\lambda \in \Lambda - \{0\}$  are apices, but  $\lambda = 0$  is not an apex
- ▶ the simple  $B_{\mathbb{Z}/c\mathbb{Z}}$ -modules of apex  $\lambda \in \Lambda$  are parameterized by simple  $S_n$ -modules

Studying representation of  $P_1 = (a, b)$  is a wild problem:

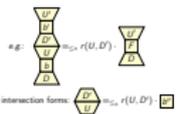

- ▶ Every choice of  $(A, B) \in (\mathbb{C}^*)^2$  gives a simple representation on  $\mathbb{C}$ . These are non-equivalent
- ▶ Every choice of eigenvalues for  $a, b$  and  $ab$  gives a simple representation on  $\mathbb{C}^2$ . Quite many conditions, these are non-equivalent
- ▶ Every choice of  $A \in \mathbb{C}^*$  gives a simple representation  $\text{Inf}_{\mathbb{C}^*}^{\mathbb{C}^*} A$ . These are non-equivalent

Beyond that you hit the realm of harmonic analysis, random walks and crazier stuff

There is still much to do...

A sandwich cellular algebra is an algebra together with a sandwich cellular datum:

- A partial ordered set  $(\lambda, \leq)$  and a set  $\mathcal{M}_\lambda$  for all  $\lambda \in \Lambda$
- an algebra  $B_\lambda$  for all  $\lambda \in \Lambda$  **The sandwiched algebra(s)**
- $s$  basis  $\{c_{\lambda, \mu}^i\} \lambda \in \Lambda, D, U \in \mathcal{M}_\lambda, \mu \in \mathcal{M}_\lambda$
- $c_{\lambda, \mu}^i \rightarrow a = \sum_{\nu \in \Lambda} c_{\nu, \mu}^i r(\nu, D') - c_{\lambda, \nu}^i r(U, D')$

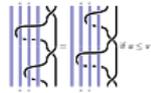

**Running example. The Bauer algebra, following Fishel-Grojnowski - 1995**

- Bauer's centralizer algebra  $B_{\mathbb{Z}/2}(c)$
- $n = 4$  example circle evaluation  $\bigcirc = c \cdot \bigcirc$
- $\Lambda = \{n, n-2, \dots\}$
- Down diagrams  $D$  = cap configurations, up diagrams  $U$  = cup configurations
- the sandwiched algebra is the symmetric group  $S_n$

**Handbody braids  $B_{\text{hb}}$  (Hikita-Ohtsuka-Lambropoulos, Virelizier - 1998)**

- Generators. Twists  $\tau_{\pm}$  and braidings  $\beta_i$
- Relations. Typical Reidemeister relations and  $\beta_i \# \beta_{i+1} = \beta_{i+1} \# \beta_i$

**Green cells - left  $\mathcal{L}$ , right  $\mathcal{R}$ , two-sided  $\mathcal{J}$ , intersections  $\mathcal{H}$**

Fusing (colored) right, left, nothing or left-right gives:

$\mathcal{J}_{\mathcal{L}, \mathcal{R}}$   $\mathcal{L}(\lambda, \mu)$   $\mathcal{R}(\lambda, \mu)$   $\mathcal{H}(\lambda, \mu)$

$c_{\lambda, \mu}^1$	$c_{\lambda, \mu}^2$	$c_{\lambda, \mu}^3$	$c_{\lambda, \mu}^4$
$c_{\lambda, \mu}^5$	$c_{\lambda, \mu}^6$	$c_{\lambda, \mu}^7$	$c_{\lambda, \mu}^8$
$c_{\lambda, \mu}^9$	$c_{\lambda, \mu}^{10}$	$c_{\lambda, \mu}^{11}$	$c_{\lambda, \mu}^{12}$
$c_{\lambda, \mu}^{13}$	$c_{\lambda, \mu}^{14}$	$c_{\lambda, \mu}^{15}$	$c_{\lambda, \mu}^{16}$

$\mathcal{H}_{\mathcal{L}, \mathcal{R}, \mathcal{L}}$   $\mathcal{H}_{\mathcal{L}, \mathcal{R}, \mathcal{R}}$

**Back to Brauer**

$\mathcal{J}_5$  with two through strands for  $n = 4$ : columns are  $\mathcal{L}$ -cells, rows are  $\mathcal{R}$ -cells and the small boxes are  $\mathcal{H}$ -cells

**Handbody braids  $B_{\text{hb}}$  (Hikita-Ohtsuka-Lambropoulos, Virelizier - 1998)**

- Generators. Twists  $\tau_{\pm}$  and braidings  $\beta_i$
- Relations. Typical Reidemeister relations and  $\beta_i \# \beta_{i+1} = \beta_{i+1} \# \beta_i$

After closing, the cores correspond to curves of odd handbodies (1998)

Group	type-A	type-C
$g = 0$	Classical affine (1925)	
$g = 1$	Extended affine	Classical (Brouwer - 1975)
$g = 2$	?	Affine (Atiyah - 1990)
$g \geq 3$	?	?

**The Clifford-Muras-Ponizavski theorem**

An apex is a  $\lambda \in \Lambda$  such that  $\text{Ass}_{\mathbb{Z}}(M) = \mathcal{J}_{\lambda, \lambda}$  and  $r(U, D)$  is invertible for some  $D, U \in \mathcal{M}(\lambda)$ . Easy fact. Every simple has a unique associated apex

- For a fixed apex  $\lambda \in \Lambda$  there exists  $\mathcal{H}_{\lambda, \mathcal{L}, \mathcal{R}} = \mathcal{B}_\lambda$
- there is a 1-1 correspondence (simple with apex  $\lambda$ )  $\mathcal{J}_\lambda$  (simple  $B_\lambda$ -modules)
- under this bijection the simple  $\mathcal{L}(\lambda, K)$  associated to the simple  $B_\lambda$ -module  $K$  is the head of the induced module

Simple-classification for the sandwiched leads down to simple-classification of the sandwiched plus apex hunting

**Brauer  $B_{\mathbb{Z}/2}(c)$  and the symmetric group  $S_n$**

- Theorem (works over any field). If  $c \neq 0$ , or  $c = 0$  and  $\lambda \neq 0$  in odd, then all  $\lambda \in \Lambda$  are apices. In the remaining case,  $c = 0$  and  $\lambda = 0$  (this only happens if  $n$  is even), all  $\lambda \in \Lambda - \{0\}$  are apices, but  $\lambda = 0$  is not an apex
- the simple  $B_{\mathbb{Z}/2}(c)$ -modules of apex  $\lambda \in \Lambda$  are parameterized by simple  $S_\lambda$ -modules

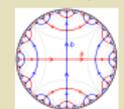

**Studying representation of  $P_3 = (a, b)$  is a wild problem:**

Every choice of  $(A, B) \in (\mathbb{C}^*)^2$  gives a simple representation on  $\mathbb{C}^2$ . These are non-equivalent

Every choice of eigenvalues for  $a, b$  and  $ab$  gives a simple representation on  $\mathbb{C}^2$ . These are non-equivalent

Every choice of  $A \in \mathbb{C}^*$  gives a simple representation  $\text{Inf}_{\mathbb{C}^*}^{\mathbb{C}^*} A$ . These are non-equivalent

Beyond that you hit the realm of harmonic analysis, random walks and crazier stuff

Thanks for your attention!
